(54) Title: MULTI-RIBBED BELT WITH TIP PROFILE

(57) Abstract: The invention comprises a multi-ribbed belt (100) wherein rib tip (32) has a concave arcuate surface (36) disposed between substantially flat surfaces (41,42), which are in turn disposed between rib side surfaces (34,35). The substantially flat surfaces are adjacent to curved surfaces (39,40), which connect to rib side surfaces (34,35). The inventive rib profile and rib compound construction significantly reduce rib tip cracking, which significantly reduces belt flex fatigue under high applied frictional torque. Further, the inventive rib profile and rib compound construction significantly reduces high localized tensile stress/strain at the rib tip and highly localized shear stress at the rib flank, thereby significantly reducing rib tip cracking and rib tear off. The inventive belt also comprises a significantly reduced contact normal force, thereby increasing an operating life of the belt.

WO 03/062666 A1

What is needed is a multi-ribbed belt having improved belt flex fatigue. What is needed is a multi-ribbed belt having improved flex fatigue under a high frictional torque. What is needed is a multi-ribbed belt having a rib tip profile to minimize rib tip cracking. What is needed is a multi-ribbed belt having a rib tip profile to minimize rib/pulley interface contact deformation. What is needed is a multi-ribbed belt having a rib tip comprising a concave surface disposed on a flat surface between rib side surfaces. What is needed is a multi-ribbed belt having a reduced contact normal force. The present invention meets these needs.

Summary of the Invention

15 The primary aspect of the invention is to provide a multi-ribbed belt having improved belt flex fatigue.

Another aspect of the invention is to provide a multi-ribbed belt having improved flex fatigue under a high frictional torque.

20 Another aspect of the invention is to provide a multi-ribbed belt having a rib tip profile to minimize rib tip cracking.

Another aspect of the invention is to provide a multi-ribbed belt having a rib tip profile to minimize rib/pulley interface contact deformation.

25 Another aspect of the invention is to provide a multi-ribbed belt having a rib tip comprising a concave surface disposed on a flat surface between rib side surfaces.

Another aspect of the invention is to provide a multi-ribbed belt having a reduced contact normal force.

Fig. 4 is a cross-section of the inventive belt showing a contact normal force.

Detailed Description of the Preferred Embodiment

5 Fig. 1 is a plan end view of the inventive belt. The disclosed rib tip profile and rib construction minimizes rib tip cracking and rib/pulley interface contact deformation, and thus enhances belt flex fatigue strength in high torque applications. The inventive belt engages
10 two or more grooved pulleys. A torque is transmitted from a driver pulley to a driven pulley by a frictional contact between a belt ribbed surface and a pulley grooved surface.

The inventive belt 100 comprises overcord layer 10, tensile cords 20, undercord 30, and ribs 31.

15 Nylon short fiber reinforced fabric is used for the overcord layer 10. Other fabrics which may be used for overcord layer 10 include nylon and polyester woven fabric. An overcord thickness is in the range of approximately 0.40mm to 0.55mm.

20 Tensile cords 20 may comprise a high modulus cord, such as aramid cords having a cord diameter of approximately 0.65mm to 0.80mm and cord spacing of approximately 22~26 epi. Cords 20 are embedded in an adhesion gum 11 having a Young's modulus in the range of
25 approximately 40 to 60Mpa. Cords 20 may also comprise polyester cord having a cord diameter in the range of approximately 0.85 to 0.94mm and cord spacing in the range of approximately 20 to 22 epi. Cords 20 are embedded in an adhesion gum 11 with Young's modulus in the range of
30 approximately 25 to 40Mpa. Other tensile cord materials also include aramid, polyester, nylon 4.6 or nylon 6.6 and

Curved surfaces 39 and 40 each describe a radius R2. Surfaces 39, 40 join substantially flat surfaces 41, 42 to rib flanks 34, 35 respectively. R2 is in the range of approximately 0.20mm to 0.75mm.

5 Curved surface 37 having radius R3 joins adjacent rib flanks 34, 35. Surface 37 has a radius in the range of approximately 0.15mm to 0.45mm.

The inventive rib profile and rib compound construction significantly reduce rib tip cracking, which
10 significantly reduces belt flex fatigue under high applied frictional torque. The compound comprises:

| Composition | Weight Parts |
|------------------------|--------------|
| Polymer (Rubber) | 100 |
| Carbon black | 5~30 |
| 15 Short Fiber (1~6mm) | 3~8 |
| Silica | 30~60 |
| Oil | 10 |
| AOX | 1 |
| CoAgent | 15 |
| 20 Cure | 6 |

Further, the inventive rib profile and rib compound construction significantly reduces high localized tensile stress/strain at the rib tip and highly localized shear stress at the rib flank, thereby significantly reducing rib
25 tip cracking and rib tear off. The smooth curved surfaces 39, 40 minimize concentrated contact deformation due to rib wedging into a pulley groove.

Fig. 2 is a graph showing a reduced rib tip tensile stress/strain for the inventive rib. In the inventive rib construction, the rib tip surface 36 contributes to
30 minimize a rib tip high tensile stress/strain during back bending on a flat pulley. The smooth curved surfaces 39,

Claims

I claim:

1. A belt comprising:

an elastomeric body having a tensile member
5 embedded therein and a pulley engaging surface;
the pulley engaging surface having a rib extending
in a longitudinal direction;
the rib having a tip describing a concave surface
disposed between substantially flat surfaces.

10

2. The belt as in claim 1 wherein the concave surface
further comprises an arcuate surface.

- 15 3. The belt as in claim 2 further comprising;

a first curved surface and a second curved surface
on either side of the substantially flat surfaces,
each joining the concave surface to a rib flank.

- 20 4. The belt as in claim 3 further comprising:

a third curved surface joining adjacent rib flanks;
and
an angle between adjacent rib flanks in the range
of approximately 34° to 46°.

25

5. The belt as in claim 3, wherein the first curved
surface and the second curved surface each have
substantially equal radii.

30

6. The belt as in claim 3 further comprising an
overcord disposed opposite a rib relative to the
tensile member.
